

Team Worksheet — Lab 6

SIPOC, Process Mapping and Scope Governance

Team members: _____

Date: _____

1. Our understanding of the problem

2. Our working

Use the data in `lab-06-sipoc-process-map.xlsx`.

3. What we produced

Deliverable: A SIPOC, a detailed swimlane process map and a documented scope boundary.

4. What the evidence does NOT tell us

5. Our conclusion

6. Step notes

Step 1. Recap SIPOC in full: Suppliers, Inputs, Process, Outputs, Customers — and why it is built right-to-left, starting from the customer.

Step 2. Open the online SIPOC tool and build the SIPOC for your capstone process at five to seven high-level steps. Agree the first and last step explicitly — that IS your scope.

Step 3. Recap process mapping symbols and conventions, and the difference between as-is and to-be maps.

Step 4. Build a detailed swimlane map of your capstone process, with one lane per role or function.

Step 5. Mark every handoff between lanes. Handoffs are where defects, delays and ownership gaps concentrate.

Step 6. Mark every decision point, inspection, rework loop and queue. Count the rework loops — each is a hidden factory.

Step 7. Walk the process physically or through the system (gemba) and correct the map. The map in your head is never the map in reality.

Step 8. Compare your map against the charter scope. Anything on the map outside the scope boundary must be explicitly marked out-of-scope.

Step 9. Record the three questions you will ask when someone proposes expanding the scope mid-project.

7. Self-check

Your SIPOC's first and last steps match your charter scope exactly, your swimlane map marks every handoff and rework loop, and the map has been validated by walking the actual process.
